

**What you will be working on?**

I am planning to use Bayesian nonparametrics to model the spatial and temporal cellular organization of tumor and stromal cells in response to drug treatment in assembloid models.

**What are you looking forward to the most in your experience as a WA Scholar?**

I'm looking forward to building connections and collaborations with computational biology communities at Stanford and beyond.

**How do you see this shaping your research and ultimately, career?**

I am grateful to the WA fellowship and community for funding and supporting an early-stage researcher like myself while I consider future careers in industry or academia.
